It was found possible to successfully utilize hybridization of plants by means of grafting to obtain new fruitful types of plants. Grafting hybridization within a species and between species formed heterogeneous material, but its character was different. A graft within a species yielded offspring combining characteristics of the graft and the wildling, and even new growth, but grafting between species—only new growth, which is defined by, (Agriculture--Plant Cultivation, TT, v. 11, no. 9)(over)
